/clone=lorgan: skin; Vector: pOTB7; Site 1: XhoI; Site 2: EcoR1; cDNA made by oligo-dT priming. Directionally cloned into EcoR1/KhoI sites using the following 5' adaptor: GGCACGG(G). Size-selected 550bp for average insert size 1: 8kb. Library constructed by Ling Hong in the laboratory of Gerald M. Rubin (University of California, Berkeley) using ZAP-cDNA synchesis kit

(Stratagene) and Superscript II RT (Life Technologies)."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a human transmembrane proteins (HTMP). Agonists and antagonists of the protein are used to treat a disease or condition associated with overexpression of the protein. Diseases and conditions which can be treated include cell proliferative, immunological, reproductive, smooth muscle and neurological disorders e.g. arteriosclerosis, myeloma, leukaemia, acquired immunodeficiency syndrome (AIDS), allergies, ovulatory defects, angina, hypertension, stroke, Alzheimer's disease, epilepsy and Tourette's disorder. The polynucleotides may be used to detect and quantify gene expression in biopsied tissues where protein expression may be correlated with disease e.g. to determine absence, presence or excess expression of HTMP or to monitor regulation of HTMP expression during therapeutic intervention.

This sequence encodes tetraspanin 23228. This protein is a cell surface protein having four transmembrane domains (TM1-TM4). TM1, TM3 and TM4 have brotein having four transmembrane domains (TM1-TM4). TM1, TM3 and TM4 have brotein the a single polar anino acid located within them, which may interact with each other and contribute to domain stability. The cytoplasmic N-terminal domains and the intracellular loop between TM2 and TM3 and TM4 contains conserved Cys residues and may function between TM3 and TM4 contains conserved Cys residues and may function to bind extracellular growth factors, such as HB-EGF, TGF-alpha and campiregulin. The 23228 protein is useful for diagnosing and treating 1328 mediated disorders, e.g., haematopoletic and/or immune disorders such as diabetes mellitus, arthritis, multiple sclerosis, such as diabetes mellitus, crohr's diseases and asthma; cell proliferation and differentiation disorders, e.g., cancers or metastasis; and/or viral infections. 23228 polypeptide can control cellular signalling activity, bind to an extracellular growth factor, for example, amphiregulin, regulate cell proliferation, bind to a cell surface protein, to recruit intracellular kinases, to regulate cell contility, bind to another tetraspanin such as CD81, to associate with a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to isolated nucleic acids and proteins encoding human soluble 4 transmembrane superfamily receptor protein (see ACC9012-C90023 and AAB49502-B45513). The present sequence is one such nucleic acid. The present sequence is useful for preventing, treating or ameliorating a medical condition and in diagnosing (susceptibility to) abtological condition e.g. endocrine disorders e.g. Addison's disease, (cardio) vascular diseases e.g. arrhythmia and atherosclerosis, parkinson's disease, reproductive disorders e.g. Alzheimer's and psoriasis, renal system disorders e.g. and produce e.g. productive disorders e.g. disorders e.g. disorders e.g. disorders e.g. and disorders e.g. hoperproliferative disorders e.g. nephritis, (auto) immune system meoplasms of the pancreas, ocular disorders e.g. glaucoma and infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         216

The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB896404) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, proteins, antibodies and (ant) agonists are useful in the diagnosis, proteins, antibodies and (ant) agonists are useful in the diagnosis, proteins, and orber of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, (c) immultiple solarosis, rheumarcid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) infectious diseases such as viral, bacterial, fungal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated polynucleotide (I) comprising a nucleotide sequence selected from any of 948 sequences (ABZ11119-ABZ12066) or their mature protein codding portion, active domain coding protein or complementary sequences. The polynucleotides are useful coding protein or complementary sequences. The polynucleotides are useful coding protein or complementary sequences. The polynucleotides are useful coding protein as a food supplement, for generating of human genome. The encoded polypeptides (ABP68902-ABP69849) are useful as molecular weight markers, as a food supplement, for generating antibodies, in cell-proliferative disorders (cancer), neurodegenerative diseases (multiple cell-proliferative disorders (alecates), autoimmune diseases (multiple disorders, platelet or coagulation disorders, wound, burns, incision, ulcars, liver or lung fibrosis, infections (bacterial, viral, fungal, culcars, liver or lung fibrosis, infections (bacterial, viral, fungal, Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO.

The human colon cancer antigens can have cytostafic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, colon be used in gene therapy. The colon cancer antigen polymuclectides, and cancer in gene proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymuclectides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent disorders, such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune diseases, and cardiovascular disorders. The diseases, and cardiovascular disorders. AAC99764 to AAC98772 and AAC987007 represent sequences used in the exemplification of the present

cell cDNA library. The invention relates to the isolation of this novel cell cDNA library. The invention relates to the isolation of this novel cell cDNA library. The invention relates to the isolation of this novel cell cDNA library. The invention relates to the sequence except for those homologues that having GenBank accession numbers AAC 17120 (human context of the man distance and is involved in regularing dopaminergic, opioid and GABA(gamma-aminobutyric acid) ergic activities. The nucleic acid that encodes the protein is used: (1) as primers or probes for detection/amplification, particularly for screening gene context of interactions and regulators of the GHBR gene; (2) for expression of recombinant polypeptides; and (3) to detect allelic abnormalities in the GHBR gene (for diagnosing diseases, or susceptibility, associated with abnormal expression of GHBR). The corrent for agents that interact with GHBR; (2) to study corrent for agents that interact with GHBR; (2) to study corrent for agents that interact with GHBR; (2) to study corrent for agents that interact with GHBR; (2) to study corrent for agents that interact with GHBR; (2) to study corrent for agents that interact with GHBR; (2) to study corrent for agents that interact with GHBR; (2) to study corrent for agents that interact with GHBR; (2) to study corrent for agents or activity of GHBR, particularly those involving cerebral GABA(gamma-aminobuyts, and (3) to raise antibodies (Ab) specific for GHBR. The agents are used to prevent or treat diseases associated with abnormal correlation of activity of GHBR, particularly those involving cerebral correlation and regulation of section of hormones (growth hormone correction of hormones (growth hormone) and and regulation of section of hormones (growth hormone correction and and regulation of section of hormones (growth hormone).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 prolactin) that are under dopaminergic control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and

The present sequence is one such nucleic acid. The present sequence is useful for preventing, treating or ameliorating a medical condition and in diagnosing (susceptibility to) a pathological condition e.g. endocrine disorders e.g. Addison's disease, (ardio)vascular diseases, neural disorders e.g. Alzheimer's and Parkinson's disease, reproductive disorders e.g. Alzheimer's and psoriasis, renal system disorders e.g. him disorders e.g. psoriasis, renal system disorders e.g. nephritis; (auto)immune system disorders e.g. set the pancreas, ocular disorders e.g. glaucoma and infections caused by bacteria, viruses and fungi.

The present invention relates to isolated nucleic acids and proteins encoding human soluble 4 transmembrane superfamily receptor protein (see PAC90012-290023 and AAB4502-849513). The present sequence is one such nucleic acid. The present sequence is useful for preventing, treating or ameliorating a medical condition and in diagnosing (susceptibility to) apathological condition e.g. endocrine disorders e.g. Addison's disease, (cardio)vascular diseases, neural disorders e.g. Alzheimer's and Parkinson's disease, reproductive disorders e.g. Alzheimer's and Parkinson's disease, reproductive disorders e.g. Alzheimer's and Psoriasis, renal system disorders e.g. nephritis, (auco)immune system disorders e.g. not disease, hyperproliferative disorders e.g. necoplasms of the pancreas, coular disorders e.g. glaucoma and infections caused by bacteria, viruses and fungi.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      40

This is the polynucleotide sequence of the clone dk129 1, which was isolated from a human fetal kidney cDNA library using methods which are selective for cDNAs encoding secreted proteins, or by identification as a secreted or transmembrane protein on the basis of computer analysis of the amino acid sequence of the encoded protein (AAY42181).

The PNB and proteins of the invention are predicted to have biological activities which would make them sultable for treating preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, hemostatic activity, chemotopiesis regulating activity, these growth activity, hemostatic activity, chemotocic/chemokinetic activity, and tumor inhibition activity, receptor/ligand activity, and tumor civity. The PNS are also stated to be useful for gene therapy. Other activities include inhibiting the growth, infection or bacteria, fungi, viruses and other parasites; effecting function of bacteria, fungi, viruses and other parasites; effecting blothythms or circadian cycles; enhancing fertility; treatment of pain; hormonal or endocrine activity.

The invention relates to novel human secreted proteins, the nucleic acids encoding them. The protein may exhibit cytokine, cell proliferation or cell differentiation activity or may induce production of other cytokines in certain cell populations and may exhibit immune stimulating or immune suppressing activity, which is useful for the treatment of various immune deficiency (SCID), which is useful for the treatment of immunodeficiency (SCID), autoimmune disorders e.g. severe combined immunodeficiency (SCID), autoimmune disorders e.g. multiple sclerosis, systemic lupus erythematosus, rheumatoid arthritis, autoimmune pulmonary inflammation. The proteins are also useful in the treatment of diseases and disorders including tissue, skin and organ transplantation and in graft-versus-host diseases (GVHD), in the induction of tumour immunity,

            in the treatment of burns, incisions and ulcers; as well as in treatment of periodontal disease, osteoporosis or osteoarthritis, mediated by inflammatory processes, diseases of the peripheral nervous system, Alzheimer's, Parkinson's disease, Huntington's disease, amylotrophic lateral sclerosis, and Shy-Drager syndrome, infections, infarction of cardiac and central nervous system vessel e.g. stroke, sepsis, inflammatory bowel disease, ulcers, bone regeneration. The protein, having activin or inhibin-related activities is useful as a contraceptive based on the ability of inhibins to decrease fertility in female mammals and decrease spermatogenesis in male mammals. The proteins and nucleic acids are also useful as food supplements. The proteins and nucleic acids are also useful as food supplements. The present sequence encodes a secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      141 AspLeuGlnAsnLeulleAspPheAlaGlnGluTyrTrpSerCysCysGlyAlaArgGly 160

processing Set 10 No. 2 (ABBSDS99) and Set 10 No. 2 (ABBSDS9707) contained in clones bd306-7 and yb8-1 respectively and the clones bd306-7 and yb8-1 are deposited with the American Type Culture Collection (ATCC) with accession number 98599. The polymucleotides and encoded polypeptides have cytostatic, anti-inflammatory immunomodulator, vulnerary.

Cytostatic, anti-inflammatory immunomodulator, themostatic, thrombolytic and anti-inflammatory activity and acting as cytokine modulators, thrombolytic and anti-inflammatory activity and acting as cytokine modulators.

Commandatopiesis regulators, tissue growth modulators and/or cadherin suppressors. The polypeptides and polymucleotides are useful in gene the following diseases: immune deficiency and disorders; e.g. bacterial cort fungal infections, autoimmune disorders, cancer, systemic lupus erythematosus or graft-versues host disease; myeloid or lymphoid cell deficiencies; wound, burns, incisions and ulcers, osteoporosis or certorathies, eog. Alzheimer's Parkinson's disease and neuropathies, eog. Alzheimer's Parkinson's disease, amyotrophic lateral sclerosis or Shy-Drager syndrome; cort systemic inflammatory response syndrome; systemic inflammatory response syndrome, is chosen, ereperfusion or stroke, inflammations, shock, sepsis or systemic inflammatory response syndrome; including vulgaris or pemphigus control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GlyLeullePhePheLeuGluLeuAlaThrGlyIleLeuAlaPheValPheLysAspTrp 120

The modulator is useful for decreasing the expression of NET-4 in a mammalian cell, and for treating neoplastic disease, such that the neoplastic disease is reduced in severity. Modulators of NET-4 are also useful for regulating cell proliferation, and for controlling gene expression through triple helix formation which promotes the ability of the double helix to open sufficiently for the binding of polymerase, transcription factors or regulatory molecules. A NET-4 modulator is useful as drug for supplementing cancer therapeutics and other agents. It is also useful in other diseases of hyperproliferation, and to inhibit tumour cell

The present invention relates to the isolation of novel cDNA sequences which encode human secreted proteins. The cDNA sequences have been derived from a variety of human tissues. The invention also provides a method for producing proteins from these polynucleotide sequences. The proteins are useful for identifying compounds that modulate their activity and production. The sequences of the invention are useful for identifying compounds that modulate their useful for treating disease such as hyperproliferative disorders (e.g. cancer), immune deficiency disorders (e.g. multiple classediciency (SCID)) autoimmune disorders (e.g. multiple classediciency (SCID)), autoimmune disorders (e.g. multiple classediciency (SCID)), infertious disorders (e.g. thepatitis), allergic conditions (e.g. athma), neurodesenerative disorders (e.g. hapatitis), allergic conditions (e.g. asthma), neurodesenerative disorders (e.g. hapatitis), haemophilia), and tumours. The polynucleotide sequences of the invention are also useful in gene therapy. ABK35510-ABK36232 represent the cDNA sequences of the invention that encode for novel human
